

Towards Algorithms

Problem: PRIORITY

Given: Parity game G with finite set of positions,
position $p \in \text{Pos}$, and player $i \in \{A, B\}$.

Question: Does $p \in U_i$ hold?

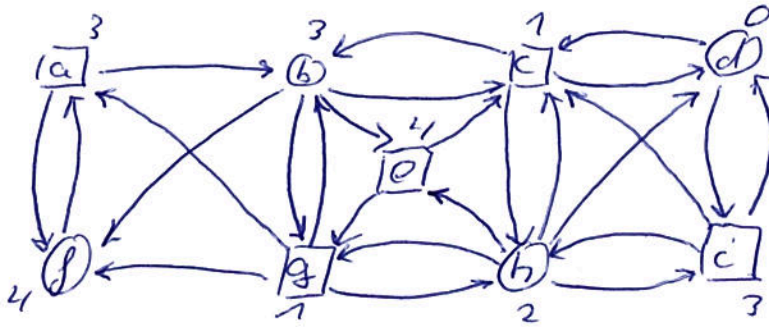

↳ First solve more general problem:

compute U_A and U_B for a given parity game G

↳ Turn the above proof into recursive algorithm

The algorithm - on an example

Consider

- Let N be the set of positions with highest priority
Say this priority is even.

In the example:

$$N = \{j, e\}$$

- Compute $\text{Attr}_A(N)$.

If A can ensure that attractor is visited infinitely often,
she wins.

In the example:

$$\text{Attr}_A(N) = \{a, b, e, g, h, i\}$$

- Compute recursively positions X from which
 B wins $\text{Pos} \setminus \text{Attr}_A(N)$.

In the example:

$$X = \{c, d, i\}$$

Case 1: X is empty:

\mathcal{H} wins everywhere

$\hookrightarrow \mathcal{H}$ wins on $\text{Pos} \setminus \mathcal{H}\text{tr}_{\mathcal{H}}(N)$

$\hookrightarrow \mathcal{H}$ certainly wins on $\mathcal{H}\text{tr}_{\mathcal{H}}(N)$.

Case 2: X is not empty

\hookrightarrow From X , \mathcal{P} wins the full game, not only $G|_{\text{Pos} \setminus \mathcal{H}\text{tr}_{\mathcal{H}}(N)}$

\hookrightarrow Reason is that \mathcal{H} cannot move to $\mathcal{H}\text{tr}_{\mathcal{H}}(N)$.

Compute $Y = \mathcal{H}\text{tr}_{\mathcal{P}}(X)$:

\mathcal{P} wins on all positions in Y .

In the example:

$$Y = \{c, d, e, e'\}$$

Solve the remaining game $\text{Pos} \setminus Y$
Well-founded as $Y \neq \emptyset$.

by recursion.

\mathcal{H} Algorithm (McNFSolve):

input: $G = (\text{Pos}_R, \text{Pos}_P, \rightarrow, \mathcal{J})$.

begin:

$n := \max\{|\mathcal{J}(p)| \mid p \in \text{Pos}\}$

if $n = 0$ then

return $\mathcal{W}_{\mathcal{H}} = \text{Pos}$, $\mathcal{W}_{\mathcal{P}} = \emptyset$;

end if

if $n = \text{even}$ then

$\sigma = \mathcal{H}$, $\tau = \mathcal{P}$;

else

$\sigma = \mathcal{P}$, $\tau = \mathcal{H}$;

end if.

$N := \{p \in \text{Pos} \mid \mathcal{J}(p) = n\}$;

$\mathcal{H}_G := \mathcal{H}\text{tr}_{\sigma}(N)$;

$(\mathcal{W}'_{\sigma}, \mathcal{W}'_{\tau}) := \text{McNFSolve}(G|_{\text{Pos} \setminus \mathcal{H}_G})$;

if $\mathcal{W}'_{\tau} = \emptyset$ then

return $(\mathcal{W}_{\sigma} := \mathcal{W}'_{\sigma} \cup \mathcal{H}_G, \mathcal{W}_{\tau} := \emptyset)$

$W_2 := \text{Nbr}_2(W_1);$

$(W_1'', W_2'') := \text{McNZSolve}(G|_{\text{Pos} \setminus W_2});$

return $(W_1 := W_1'', W_2 := W_2 \cup W_2'');$
end

Theorem:

PARITY is in $\text{NP} \cap \text{coNP}$.

P.oo:

Given game G , position p , player Π .

In NP:

↳ guess a positional strategy s for player Π .

(can be done in $O(1 \rightarrow 1)$).

↳ consider subgraph G' induced by s :

$\rightarrow' := \{(p; s(p)) \mid p \in \text{Pos}_\Pi\} \cup \rightarrow \cap \text{Pos}_\Pi \times \text{Pos}_\Pi$.

(can be constructed in $O(1 \rightarrow 1)$)

↳ s is a winning strategy iff

highest priority in every cycle that is reachable from p is even.

(can again be checked in polynomial time.)

In coNP:

↳ Remember, PARITY in coNP iff complement in NP.

So given game G , position p , player Π ,

check if $p \notin W_\Pi$.

↳ Looks like we have to consider all strategies.

↳ But

$p \notin W_\Pi$ iff $p \in W_P$ by determinacy.

↳ Use above NP algorithm to search for strategy for P . □
